

Hydrosmart-treated water helps solve horse weight struggles

Craig Osborne raises horses in the Australian outback. He started treating his water with Hydrosmart water conditioners in the middle of August and has observed impressive results after the first few weeks.

Horses struggling to put on weight

Mr Osborne had been experiencing significant trouble getting his horses to put on weight, even though they were eating a lot of food. Other attempts to solve the problem, including getting the animals' stomachs cured for sand and performing blood tests, failed to turn up any promising solutions.

When he noticed that his horses gained weight while away at other locations, such as fairs, he realised something could be awry with his water. The issue, he believed, had to do with alkaline elements in his bore water interfering with the way the acids in the horses' stomach worked - thereby preventing them from processing carbohydrates correctly and benefiting from the nutrients.

His water was very hard with high salinity - qualities that are harmful for both plants and animals.

Turning to Hydrosmart

That's when Mr Osborne decided to try Hydrosmart. The water conditioner technology in a Hydrosmart solution uses electromagnetic waves to break up large mineral bonds that cause build-up and prevent nutrients from being available to plants and animals. Because it doesn't use any chemicals, Hydrosmart is safe for livestock.

Having heard positive reviews by word of mouth, he installed the technology in the water system he uses for his horses. The unit was extremely convenient and simple to set up. In fact, Mr Osborne needed only basic plumbing knowledge and the right glues and fittings to put it into place. He was also impressed by the helpfulness of the people at Hydrosmart.

Right away he noticed a difference in his animals. They were much more relaxed, started gaining weight and generally looked better - which was especially promising since it was still winter.

"The results are really good. I think in the future I'll have some really big results and terrific differences with livestock," he said.

Additional benefits

Although Mr Osborne was drawn to Hydrosmart to help his horses put on weight, the results didn't end there. He tested the effects of the technology by using the water on areas of his lawn and around his home.

Even with just a few waterings, his plants and grass have started to perk up. In the house, the scale and iron deposits he once had to scrub off surfaces, such as his showerheads, are already starting to reduce.

Mr Osborne also noticed he doesn't need to use as much dish soap. Because there are more suds, he now uses one-third as much as he required in the past. This happens because Hydrosmart's technology breaks down the large molecular bonds that previously locked up soaps and prevented them from lathering.

Bright expectations

Given the results that Mr Osborne has seen after using Hydrosmart for only a few weeks, he's expecting even more impressive outcomes for his plants and livestock as spring brings warmer weather. He strongly recommends the product for other farmers, especially for those facing similar issues with poor-quality bore water sources.

From animals' health to crop growth, having soft water can make a difference where other approaches fall short. It's an easy, long-term solution to problems that have consistently presented significant obstacles for farmers in Australia.
